FOR IMMEDIATE RELEASE

**Stage 1 Burn Ban Now in Effect for Clark County**

Outdoor burning and the use of fireplaces and uncertified woodstoves is prohibited until air quality improves. Households without an alternative heat source are exempted.

**VANCOUVER, Wash.** – Due to stagnant conditions and elevated air pollution levels, the Southwest Clean Air Agency (SWCAA) is issuing a Stage 1 Burn Ban effective immediately for all of Clark County. This means that the use of all fireplaces, uncertified woodstoves and inserts is prohibited until air quality improves and the Stage 1 Burn Ban is lifted. If wood burning is your only source of heat, you are exempt and we ask that you burn as cleanly as possible. All outdoor burning is also prohibited during this Stage 1 Burn Ban. This Stage 1 Burn Ban will remain in effect until our monitors show demonstrated improvement in our air quality and weather forecasts indicate improved ventilation.

During cold weather with little or no wind, wood smoke pollution can accumulate to levels that are considered unhealthy. Fine particles released by smoke from woodstoves, fireplaces and other burning are of concern because they can reach deep into the lungs. Episodes of high fine particle pollution can trigger asthma attacks, cause difficulty breathing and make lung and heart problems worse.

If air quality continues to deteriorate, SWCAA may have to issue a Stage 2 Burn Ban which would prohibit all wood burning, including fireplaces, certified woodstoves, inserts and pellet stoves. This would exclude homes where wood burning is the sole source of heat.

“We are not asking anyone to go without heat, but to use an alternative source of heat if
possible until our air quality improves,” said Randy Peltier, operations manager for the agency.

These curtailments occur in two progressive stages as needed:

**Stage 1:** The use of all fireplaces and uncertified woodstoves and inserts is banned when pollution is forecasted to reach unhealthy levels. Uncertified units are typically older than 1990 and lack a certification label on the back of the unit. Certified woodstoves and inserts are allowed during a Stage 1 Burn Ban.

**Stage 2:** All wood heating is prohibited, including certified units, when the Stage 1 curtailment has not reversed the increasing pollution trend and weather conditions still indicate a high risk for exceeding air quality health standards.

These curtailments will not apply to homes with no other source of adequate heat. All outdoor burning is also banned during these burn bans.

**Tips for Cleaner Burning:**

The most complete and effective way to reduce wood smoke pollution is to use another form of heat. If you must use wood, or choose to do so when local rules permit, the following recommendations can help diminish the emissions from your woodstove, fireplace or fireplace insert:

- Only burn dry, seasoned wood. Be sure your firewood has been split and dried for at least one year.
- Never burn wet, painted, stained or treated wood, color newsprint, plastic, garbage, diapers or magazines. Items such as these produce high amounts of odor, smoke and toxic fumes. Burning these materials is illegal and also an excellent way to start a chimney fire.
- Store your firewood under cover. A shed or shelter is best. If you use a plastic tarp, allow ventilation to prevent condensation.
- Burn small, hot fires. This helps the wood burn completely and cleanly.
- Never allow the fire to smolder. Smoldering fires are the worst polluters because they
burn at a temperature too low for efficient combustion. The result is more smoke—
unburned wood going up the chimney, wasted.

· Do not damper too much. Allow enough air for the wood to burn fully, without
smoldering. Never try to keep the fire going overnight by cutting back the air supply.
This wastes wood, produces much smoke and creosote and produces little heat.
· Step outside and look at the plume from your chimney. You should see only heat
waves. If you can see smoke, your wood is not burning completely. Increase the air
supply to your fire.
· Size your woodstove properly. A stove that is too large for the space to be heated will
have to be damped down, causing much smoke and wasting wood.
· Do not burn in moderate temperatures. Your stove will tend to overheat your house.
You will want to close the dampers to cut back on the heat, which cuts oxygen to the
fire, wastes wood and increases pollution.
· Don’t install a woodstove until you have considered other ways to cut heating costs.
Insulating and weather stripping can cost less than a stove and will reduce your
heating requirements, whether your heat sources is wood, oil, gas or electricity.
· Don’t install an uncertified stove—installation of uncertified stoves is illegal. These
stoves are more polluting.

Founded in 1968, the mission of the Southwest Clean Air Agency is to preserve and enhance
the air quality in southwest Washington. Serving the counties of Clark, Cowlitz, Lewis,
Skamania and Wahkiakum, SWCAA is responsible for protecting the public’s health through
the enforcement of federal, state and local air quality standards and regulations.
